

# COVID-19 Mobile Application

## Monitoring Instructions

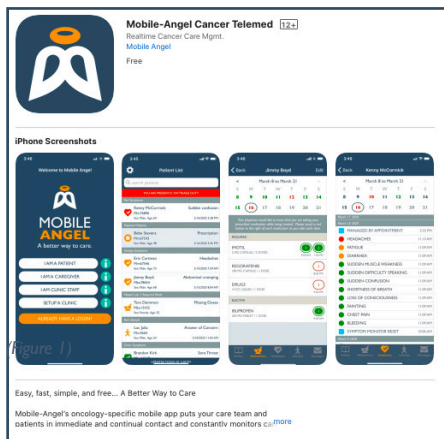

## Overview

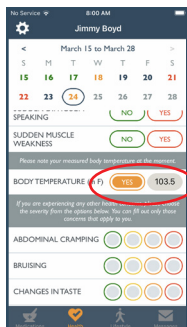

COVID-19 parameters utilize 100% of the Mobile-Angel cancer engagement application with a few added COVID-19 fields. Below are the fields you will see in the base application. We recommend you watch the Mobile-Angel Demo Overview video on the main web page first and then these COVID-19 specific features. There is only one application for creating a clinic, staff, and patients. It is available in the Apple iOS App Store. Search under Mobile-Angel. We have added an explicit temperature entry field when a patient reports any symptoms. This field will trigger alerts for the clinic staff if the patient's temperature goes above 103.5. Each temperature reported is recorded and available for the clinic staff to review.

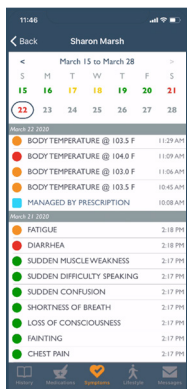

## Getting Started

1. Search the App Store under Mobile-Angel to download the app (Figure 1).
2. After you download the app, enter as either a Clinic, Staff, or Patient member.
3. Whoever sets up the Clinic becomes the the Clinic Administrator of the site (you can always change it once the site is set up). Staff or patient members can only access the site after they receive an invite code from the Clinic Administrator.
4. Once you enter code, you'll be able to use the app.
5. Then, the Administrator and/or Staff members can add staff and/or patients. The Patient can only add a Caregiver.

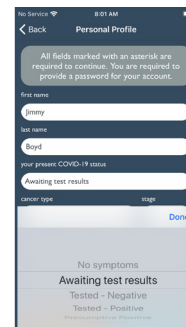

(Figure 2)

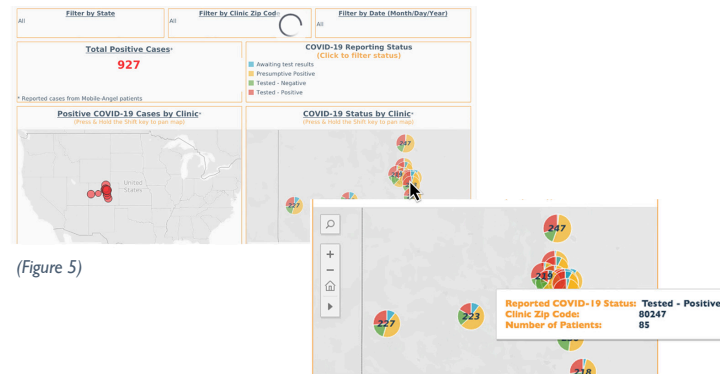

(Figure 3)

6. The Mobile-Angel app now has an explicit temperature entry field when a patient reports any symptoms. This field will trigger alerts for the clinic staff if the patient's temperature goes above 103.5. Each temperature reported is recorded and available for the clinic staff to review (Figure 2).
7. All intelligent alerts to clinic staff are active for any reported problems (exactly the same as Mobile-Angel use for cancer patients).
8. Patients or staff can change the status of patients showing symptoms of COVID-19. The options are No Symptoms, Awaiting Test Results, Tested- Negative, Tested-Positive, Presumed Positive, and Deceased. This reporting is important for the clinic, zip code, city, state and national monitoring at a real-time detailed level (Figure 3).

(Figure 4)

9. This data is used to monitor the volume of patients related to each status. The clinic data is aggregated and can be visualized on the Mobile-Angel COVID-19 Map on our website at [www.mobile-angel.com](http://www.mobile-angel.com). This reporting is not reported by individual patient in an identifiable way (Figure 4).
10. The below map is on the Mobile-Angel website and reports real-time data from all reporting patients. Hovering over a clinic will show the distribution of the patients current status. (Figure 5).

(Figure 5)

Useful data from the map will not be available until sufficient patients are reporting. The application is free, and we can scale across all clinics in the US immediately. You can help by encouraging your clinic and your elected officials to ask local clinics to download and use Mobile-Angel. It is free to everyone!

Refer to the individual user  
guides for additional details for  
Staff, Patients, and Caregivers.
